Canada's boreal region can be divided into seven ecozones. These seven can be divided into two main groups. The northern regions of the boreal forest consists of four eco-zones – Taiga Cordillera, Taiga Plains, Taiga Shield and Hudson Plains – that are the most thinly treed areas where the growing season and average tree size progressively shrinks until the edge of the Arctic tundra is ...

Taiga (/ ˈ t a ː ˈ ʃ ɪ ː /; Russian: тайга, IPA: ˈ t a j ɡ a ; possibly of Turkic or Mongolic origin), also known as boreal forest or snow forest, is a biome characterized by coniferous forests consisting mostly of pines, spruces, and larches.. The taiga is the world's largest land biome. In North America, it covers most of inland Canada, Alaska, and parts of the northern continental United States.

Selection Methodology. The Global Ecoregions are the results of regional analyses of biodiversity across the continents and oceans of the world, completed in collaboration with hundreds of regional experts worldwide and by conducting extensive literature reviews.

Biodiversity Over 80% of the world's terrestrial biodiversity can be found in forests - from pine trees in the boreal North to the rainforests in the tropics. The degradation and loss of forests threaten the survival of many species, and reduce the ability of forests to provide essential services such as clean air and water, healthy soils for agriculture, and climate regulation.

Project Drawdown is the most comprehensive plan ever proposed to reverse global warming. We gathered a qualified and diverse group of researchers from around the world to identify, research, and model the 100 most substantive, existing solutions to address climate change. What was uncovered is a path forward that can roll back global warming within thirty years.

Deforestation in North America: Past, Present and Future

I am broadly interested in ecology and diversity patterns of forest taxa and the ecosystem processes they are involved in. Particularly interesting are effects of forest management and natural disturbances on forest biodiversity and ecosystem processes and how conservation measures can be integrated in forest management.

Wetlands play an important role in the provision of important ecosystem services like the provision of clean water to the world, adaptation to climate change, and support for biodiversity; although they are sometimes also associated with adverse climate effects.
